SIEM

Security Information & Event Management

Security insight into all of your network providing real time threat detection. Keep your data and your business secure with one safe place. SIEM is a powerful product that combines security information and event management together in one solution.

SIEM automatically consolidates and logs event data produced from multiple sources residing on your network, including security devices, servers, databases, workstations, and more so that it can be examined from a single point of view.

It's not a matter of if, it's a matter of when.

Employee and customer data, bank account and credit card information, intellectual property and trade secrets. These are just a few of the assets that most every business possesses — and hackers find valuable! Without the right security measures in place, there is high risk that these assets will fall into the wrong hands.

Shorten the amount of time you become aware of breaches.

SIEM is like a smoke detector for your network's security. By gathering and weeding through extreme volumes of data, SIEM's forensics can quickly interpret the information to identify anomalies and security threats, as well as other issues, so defensive actions can be taken quickly. SIEM logs are collected and encrypted for long term storage and reporting which helps to address many compliance reporting requirements in a holistic, high level approach for regulated businesses.

Is SIEM just for regulated businesses?

SMBs are targeted more often than larger enterprises, with much greater impact, because they are usually easier prey. Most lack the monitoring, forensics, logs, security defenses and warning systems that would alert them to a breach. Whether you are a small to medium sized business who cares about security or a business who cares about both security and compliance, SIEM can help you protect your business.

If you are a Keysuite client, Locknet can even manage SIEM for you and respond as soon as an event is identified.
